US DISASTER DECLARATIONS DASHBOARD

One-page User Guide

Purpose

This Power BI report explores FEMA disaster-declaration records across geography, time, incident types and assistance-program indicators. It provides summary KPIs, interactive analysis and a frequency-based scenario view.

Five report pages

Using filters and visuals

Select a slicer value to filter the page; use its clear-selection icon to reset it. Select a bar, map location or data point to cross-filter/highlight other visuals where enabled. Use visual-header options for focus mode, sorting or export where available.

Scenario and data limitations

The Frequency parameter is configured from -20% to +20% in 5-percentage-point steps, with 0% as the default. Scenario outputs are sensitivity-analysis results, not official forecasts. The source dataset does not contain actual PA funding expenditure. Any PA funding value is an illustrative estimate based on a stated average-funding assumption, not actual FEMA spending.

Counts represent rows in the loaded declaration table and may not equal unique real-world incidents. Duration and time-to-declaration are blank when required source dates are missing.

For definitions, modelling assumptions, validation and refresh instructions, refer to the Technical Documentation.

Page	What it shows / how to use it
1. Overview	Total Disasters, Average Duration, Total PA, Total HM and Total IA KPI cards. Use declaration-date/year and incident-type slicers.
2. Geographic Analysis	US state map and Top 10 designated-area/county bar chart. Select a state or area to cross-filter visuals where interactions are enabled.
3. Temporal Trends	Monthly disaster trend and program declaration trend. Use date filters to focus on a period.
4. Incident & Program Insights	Compare PA, IA and HM by incident type; explore DisasterDuration against TimeToDeclaration in the scatter plot.
5. Scenario Insights	Adjust the Frequency parameter and review projected disaster and IA counts and the estimated PA funding output.
